## BUFFALO, N. Y.

Passed Asst. Surg. Frost reports: During the week ended October 19, 1912, six cases of poliomyelitis were reported to the commissioner of health as occurring in the city of Buffalo. Of these six cases two were well past the acute stage when reported, having had their onset more than a month previously. The steady decline in the number of cases reported during the last three weeks would indicate almost unmistakably that the epidemic has passed its apex, and so far as any predictions may be made it may be expected that from this time only scattering cases will occur here.

## ALASKA.

Passed Asst. Surg. Krulish reports, October 1, the occurrence of poliomyelitis (infantile paralysis) among the Eskimo of St. Michael and Unalakleet, Alaska. At St. Michael there were 5 cases with 1 death. These cases all occurred in the same week. The history of these cases as given by the parents was that the child had been entirely well previous to the attack, the onset was sudden, with vomiting, headache, acute pain along the spine, and slight fever; paralysis of the flaccid type followed. At Unalakleet there were 10 cases with 2 deaths. The village of Unalakleet is 45 miles from St. Michael, and the natives are in constant communication. It appears from the history of the cases that the disease appeared at Unalakleet at least a week before its appearance in St. Michael. The onset and symptoms of the cases were similar in both localities.
